INVESTOR IN PEOPLE

The Patent Office  
Concept House  
Cardiff Road  
Newport  
South Wales  
NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Signed

Dated 5 April 2004

**Warning**

*After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.*

**Notes**

- a) If you need help to fill in this form or you have any questions, please contact the Patent Office on 0645 500505.
- b) Write your answers in capital letters using black ink or you may type them.
- c) If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- d) If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- e) Once you have filled in the form you must remember to sign and date it.
- f) For details of the fee and ways to pay please contact the Patent Office.

## EVALUATION OF EVENT PROPOSALS

This invention relates to evaluation of event proposals and in particular to a method and apparatus for evaluating and generating responses to meeting proposals.

5        There are a number of known techniques for scheduling meetings and similar types of event. At a basic level, it is known to apply various types of optimisation algorithm to the problem of finding a meeting slot that satisfies constraints on participant availability. More sophisticated techniques are able to consider meeting location and the identity of other invited participants, besides time-related  
10 parameters, when attempting to define a meeting acceptable to some degree to a group of meeting invitees. However, in view of the escalating difficulty in satisfying participant constraints as the number of potential participants increases, the types of event parameter considered in current scheduling techniques is necessarily restricted, for example to a consideration of meeting time, location and other invitees.

15        In order to "soften" the constraints to be taken into account when attempting to define the parameters of a meeting, it is known for participant preferences related to day, time and duration, for example, to be defined as fuzzy sets. Fuzzy logic processing is then be applied to combine a participant's preferences with respect to the parameters in a meeting proposal to determine the degree to  
20 which the participant's preferences are satisfied overall. The results of this analysis are then used to decide whether or not the meeting proposal is acceptable. This function may be performed by a software agent acting on behalf of a potential meeting participant.

      However, binary-style responses are not particularly useful when the  
25 scheduler is attempting to find the *best possible* meeting, e.g. when attempting to set up a meeting with as many of the invited participants as possible (for, say, 100 invitees). For example, 90 people attending at 10:00am on a Monday may be better than 91 people at 4:30pm on a Friday, or 70 people attending with all the senior managers present may be better than 90 people with none.

30        According to a first aspect of the present invention, there is provided a method for generating a response to a meeting proposal for use by a meeting scheduler, the meeting proposal comprising at least an indication of timing, location and invitees for the meeting, the method comprising the steps of:

(i) applying a first rule set to augment the meeting proposal with a measure of the assessed importance of each invitee or group of invitees to the proposed meeting; and

(ii) applying a second rule set to evaluate the augmented meeting proposal  
5 in respect of each said invitee or group of invitees, deriving at least a measure of the importance of the meeting to said invitee or group of invitees for use in the evaluation, and to generate a measure of the support by said invitee or group of invitees for the proposed meeting for use in a meeting scheduler.

A successful meeting agent ("attendee agent") needs to usefully combine  
10 information from a variety of sources to assign importance and preference values to proposed meetings and slots. Prior art has included methods for assigning preferences based on time and acquaintances but these need to be specified by the user. They have not included *importance* factors with respect to i) each attendee and ii) the meeting to the user.

15 Preferably, the method according to this first aspect of the present invention further comprises the step:

(iii) in response to the inclusion or non-inclusion by said meeting scheduler of said invitee or group of invitees in a list of attendees for the proposed meeting, receiving feedback from said invitee or group of invitees, and adjusting said first or  
20 second rule sets in response thereto.

Self-adaptivity of a meeting agent has been shown to be highly advantageous in that it greatly reduces the quantity of user input required to fine-tune operation of the agent operating on the user's behalf.

Preferred embodiments of the present invention provide: i) a method of  
25 augmenting a meeting proposal to assign importance values to potential attendees; ii) means of calculating the importance value of a meeting to a user; iii) combining exterior sources of information with diary information to reply to a meeting proposal in a nuanced manner using fuzzy rules; and iv) a method for adapting these fuzzy rules given feedback from the user.

30 An attendee agent according to preferred embodiments of the present invention is arranged to find appropriate preference information in respect of each meeting invitee and to combine that information to form an appropriate output which can be used by many known scheduling methods. The attendee agent uses exterior

information to estimate factors relevant to a proposed meeting slot. In particular the agent decides on *importance of the meeting to the user* and *importance of the user to the meeting* on behalf of each invitee. A proposer agent uses fuzzy systems to combine exterior information to augment a meeting proposal. The attendee agent  
 5 uses a learned *overall busyness* of each invitee from responses to previous proposals. It combines this information with the position of each invitee within a respective organisation or within an acquaintance list to assign a value corresponding to *the importance of invitee to the meeting* for each invitee.

The preferred attendee agent uses fuzzy systems to combine calendar, slot  
 10 preference and importance information and to respond to a meeting proposal with a value in the range [0,1] (where 0 means "cannot attend" and 1 means "can attend, and this is the ideal time"). The attendee agent uses exterior information to estimate importance, busyness and availability values from exterior information (e.g. diary, user interest profile, organisation chart.)

15 An advantageous feature of preferred embodiments of the present invention is adaptability and tolerance for uncertainty. The processes described in the detailed description below use what is known as "soft computing" techniques. These techniques provide for linguistic definition of intervals as well as mechanisms to adapt the mapping between intervals and linguistic terms. For example the meaning  
 20 of the word "High" depends upon the context and the usage, e.g. temperature of a room in comparison with the temperature of a furnace. The reason why these techniques are useful in the context of meeting evaluation is because of their power to summarise, so that simple rules may be used to handle large intervals. Typically this makes the resultant software agents easier to develop, interpret and maintain.

25 Preferred embodiments of the present invention will now be described, by way of example only, with reference to the accompanying drawings of which:

Figure 1 shows an arrangement of software agents for use in generating responses to a meeting request according to preferred embodiments of the present invention;

30 Figure 2 shows a proposer agent apparatus according to a preferred embodiment of the present invention;

Figure 3 is shows an attendee agent apparatus according to a preferred embodiment of the present invention;

Figure 4 is a diagram representing the data entities involved in the operation of a preferred proposer agent;

Figure 5 is a diagram representing the data entities involved in the operation of a preferred attendee agent;

5        Figure 6 shows three flow diagrams defining steps involved in three different types of attendee feedback in response to a scheduled meeting according to a preferred embodiment of the present invention;

Figure 7 is a flow diagram showing preferred steps in adapting fuzzy rules and/or rule weights in response to received attendee feedback;

10       Figure 8 is a flow diagram showing steps in updating a fuzzy set representative of a preferred measure of user busyness according to a preferred embodiment of the present invention; and

Figure 9 is a flow diagram showing steps in updating a fuzzy set representative of preferred measures of importance according to a preferred  
15       embodiment of the present invention.

Preferred embodiments of the present invention will now be described in the specific context of their application to the generation and evaluation of meeting proposals, wherein the results of the evaluation are useable by known schedulers. However, it would be clear to a person of ordinary skill in the art that the present  
20       invention may be modified to generate and evaluate proposals for other types of event to be scheduled.

A simple arrangement of software agents for use in generating responses to a meeting request according to preferred embodiments of the present invention will now be described in outline with reference to Figure 1. The preferred arrangement of  
25       Figure 1 is intended to show that functionality for generating meeting proposals is preferably implemented separately from functionality for evaluating meeting proposals so generated. Any preferred external sources of information to be used by the software agents are omitted from Figure 1.

Referring to Figure 1, a proposer agent 100 is arranged to receive a meeting  
30       request 105 issued by a user or by another software agent. The meeting request 105 comprises parameters defining those characteristics of the meeting that the requester wishes to specify. In particular, the meeting request 105 preferably comprises an indication of a time and duration of the requested meeting and a list of invitees.

---

Optionally, the meeting request 105 may also comprise an indication of the meeting topic and an agenda for the meeting. The proposer agent 100 is arranged to augment the received meeting request 105 with at least one further parameter in respect of each invitee or group of invitees and to generate a respective meeting proposal for each invitee or group of invitees, as will be described below according to a preferred embodiment of the present invention. The proposer agent 100 is arranged to pass each generated meeting proposal to an attendee agent 110 representing the respective invitee or group of invitees. Each attendee agent 110 is arranged to evaluate a received meeting proposal and to generate a response to the proposal comprising a value in the range [0,1]. A preferred technique for evaluating a meeting proposal and for generating the response value will be described below according to a preferred embodiment of the present invention. The response values are intended for use by a meeting scheduler agent, not shown in Figure 1, to enable an attendee list to be determined and communicated to the meeting requester and to the attendees themselves. A preferred technique by which attendees on the determined list may provide feedback, for example to request a reschedule of the proposed meeting or to request adjustment of particular meeting parameters, will also be described below according to a preferred embodiment of the present invention.

A apparatus for implementing preferred functionality of a proposer agent 100 will now be described with reference to Figure 2 according to a preferred embodiment of the present invention.

Referring to Figure 2, a proposer agent 100 is shown, arranged to receive meeting requests 105 and arranged with access to a store 210 of fuzzy rules and rule weights, a store 215 for containing organisational information in respect of at least some of the invitees specified in a received meeting request 105 and a store 220 for containing information, gathered by the proposer agent 100 for example, relating to the attendance history of meeting invitees. As will be described below, preferred embodiments of the proposer agent 100 are arranged to process information contained in the stores 210-220, using conventional fuzzy processing techniques, to generate a meeting proposal 225 corresponding to a received meeting request 105. The meeting proposal 225 may comprise a single proposal for sending to all attendee agents 110, or a plurality of meeting proposals 225 may be generated,

each one individually tailored to an invitee or group of invitees and directed to their respective attendee agents 110.

A apparatus for implementing preferred functionality of an attendee agent 110 will now be described with reference to Figure 3 according to a preferred  
5 embodiment of the present invention.

Referring to Figure 3, an attendee agent 110 is shown, arranged to receive a meeting proposal 225 in respect of a particular invitee or group of invitees. The attendee agent 110 is arranged with access to a store 315 of fuzzy rules and rule weights, a store 320 for containing user profile information for at least some of the  
10 invitees specified in the meeting proposal 225, a store 325 for containing organisational information in respect of at least some of the invitees specified in the meeting proposal 225, the store 325 being preferably the same store 215 as used by the proposer agent 100 in Figure 2, and to at least one diary agent 330 in respect of invitees specified in the meeting proposal 225. As will be described below, preferred  
15 embodiments of the attendee agent 110 are arranged to process information contained in the stores 210-220, using conventional fuzzy processing techniques, to generate a response to the received meeting proposal 225 comprising a value preferably in the range [0,1] for the respective invitee or group of invitees.

Operation of a proposer agent 100 according to a preferred embodiment of  
20 the present invention will now be described in more detail with reference to Figure 4.

Referring to Figure 4, and additionally to Figure 2, the preferred proposer agent 100 comprises a fuzzy processor 400 arranged to implement a conventional fuzzy processing technique (see reference above), with reference to a set of fuzzy rules 405 and corresponding rule weights 410, to combine data entities relating to  
25 and derived from meeting request parameters 415 in order to generate a meeting proposal 225. As mentioned above, the fuzzy processor 400 operates to augment the parameters supplied in a meeting request 415 with at least one further parameter derived in respect of each invitee or group of invitees specified in the meeting parameters 415. Preferably the fuzzy processor 400 is arranged to use a different  
30 fuzzy rule set 405 and corresponding rule weights 410 to generate each further parameter. The rule weights 410 may be personalised to each invitee to enable the performance of the proposer agent 100 to be personalised, or a single set of rule

weights 410 may be used, enabling the performance of the proposer agent 100 to be adjusted on a broader basis, e.g. with respect to an organisation as a whole.

The fuzzy processor 400 is arranged, in particular, to generate a further parameter, preferably in the form of a fuzzy set, indicative of the importance of each invitee to the meeting requested (415). Preferably, the invitee importance parameter is derived by combining information 420 defining an invitee's position in a respective organisation, obtained from a store 215 containing organisational information, with information 425 relating to the invitee's attendance history at previous meetings, obtained from a store 220 containing user attendance history, and the other parameters 415 in the meeting request 105 relating to time and duration.

Preferably, a fuzzy rule 405 of the following type is used by the fuzzy processor 400 to derive a value indicative of an invitee's importance to the requested meeting (105, 415):

15        IF seniority\_of\_attendee is HIGH  
          AND regularity\_of\_attendee is HIGH  
          THEN importance\_of\_attendee is HIGH

Fuzzy sets are included within the fuzzy rule store 210 to define the meaning of HIGH in respect of each parameter of the rule. Other fuzzy sets may define for example "LOW" as required by different fuzzy rules 405. Preferably, fuzzy sets used in the conditional portion ("IF" portion) of a rule are personalised to each invitee or group of invitees so that the information 420 and 425 may be interpreted in a personalised manner by the fuzzy processor 400. A "high" attendance rate for one invitee may be quite different to that for another.

Having applied the fuzzy rule 405 in respect of each invitee or group of invitees specified in the meeting request parameters 415, the user importance parameters so determined are included, along with the other meeting request parameters 415, in a meeting proposal 225 output by the fuzzy processor 400. As mentioned above, this meeting proposal 225 may comprise a single proposal to be directed to the attendee agents 110 representing each of the specified invitees, or it may be personalised so some extent, for example to remove certain pieces of

confidential information in respect of certain invitees, or simply to generate a more personalised meeting proposal 225 in respect of particular invitees.

The fuzzy processor 400 may also be arranged to receive user feedback 430 from invitees and to use the feedback 430 both in the generation of further meeting proposals 225 and in updating personalised rule weights 410 and fuzzy sets. A preferred process for handling user feedback 430 will be described below.

Operation of an attendee agent 110 according to a preferred embodiment of the present invention will now be described in more detail with reference to Figure 5. Preferably, the attendee agent 110 operates on behalf of a single invitee or group of invitees to generate a response to a received meeting proposal 225 that is usable by a meeting scheduler.

Referring to Figure 5, and additionally to Figure 3, the preferred attendee agent 110 comprises a fuzzy processor 500 arranged to implement a conventional fuzzy processing technique (see reference above), with reference to a set of fuzzy rules 505 and corresponding rule weights 510, to combine a predetermined set of data entities in order to generate and output a response to the received meeting proposal 225 in the form of a value in the range  $[0,1]$ . The set of data entities to be combined by the fuzzy processor 500 relate to and are derived from information contained in a received meeting proposal 225, preferably with reference to the information sources 320-330 shown in Figure 3. The set comprises parameters taken directly from the received meeting proposal 225 itself and parameters separately derived, preferably by the fuzzy processor 500 in a pre-processing step, on receipt of the meeting proposal 225. As with the proposer agent 100 above, the fuzzy processor 500 is arranged to use a different fuzzy rule set 505 and corresponding rule weights 510 to generate each of the data entities that need to be separately derived and a further rule set 505 and rule weights 510 to generate the response to the meeting proposal 225. The rule weights 510 and any fuzzy sets corresponding to the fuzzy rules 505 are preferably personalised to the individual invitee or group of invitees represented by the attendee agent 110 to enable its performance to be personalised.

The following set of data entities is used by the fuzzy processor 500 to determine a response value for a meeting proposal 225, on behalf of the invitee or group of invitees, according to a preferred embodiment of the present invention:

*Busyness of invitee at the proposed time 515*

- this parameter has a value in the range [0,1] derived, preferably, by the fuzzy processor 500 using a corresponding fuzzy rule 505 and rule weight 510 to combine information obtained from a user diary agent 330 relating to the invitee's diary commitments at or around the proposed meeting time, and from historical information of responses to previous meeting proposals by the invitee(s);

*Importance of invitee to the meeting 520*

- this parameter has a value in the range [0,1] and was determined by the proposer agent 100 in respect of the invitee or group of invitees and supplied in the received meeting proposal 225;

*Availability 525*

- this parameter comprises a fuzzy set {true, false} indicating the degree of support for whether the invitee is available (true) and not available (false). Preferably, this parameter is derived by the fuzzy processor 500 using a corresponding fuzzy rule 505 and rule weight 510 to combine information drawn from one or more sources identifying reasons, other than purely temporal, that may affect the invitee's availability, for example being located too far away to be able to travel conveniently to the proposed meeting location;

*Preferences 530*

- this parameter has a value in the range [0,1] derived, preferably, by the fuzzy processor 500 using a corresponding fuzzy rule 505 and rule weight 510 to combine information derived, in particular, with access to a user profile store 320 relating not only to the invitee's interests, as compared with the topic or agenda of the proposed meeting 225, but also to preferences for particular times of day, days of the week, locations, etc. as compared with the corresponding parameters in the meeting proposal 225 (insofar as they are specified);

*Importance of meeting to the invitee 535*

- this parameter has a value in the range [0,1] derived, preferably, by the fuzzy processor 500 using a corresponding fuzzy rule 505 and rule weight 510 to combine, for example, information about the invitee's position in the organisation, obtained from the store 325 of organisational information, with information obtained from the user profile store 320 regarding the invitee's interests, and information recording the invitee's regular meeting partners, stored for example in the user attendance history store 220 accessible also to the proposer agent 100. A rule 505 of the type

10 IF seniority\_of\_any\_invitee is HIGH  
AND number\_of\_regular\_attendees is HIGH  
AND match\_of\_agenda\_to\_user\_profile is HIGH  
THEN importance\_of\_meeting is HIGH

15 may be used to determine a value in the range [0,1] for this parameter. As above, fuzzy sets, personalised to the invitee or group of invitees represented by the attendee agent 110, are stored to define the meaning of HIGH in respect of each parameter tested by the rule 505. If the result of applying this rule 505 is a fuzzy set HIGH, then this may be translated into a value for output, in the range [0,1], chosen to represent "HIGH". This value may be adjusted in response to feedback 540 by the invitee or group of invitees represented to enable the performance of the attendee agent 110 to be fine-tuned.

A preferred process by which user feedback 540 may be used to adjust rule weights 510 and fuzzy sets (505), and hence the operation of the fuzzy processor 500, will be described below.

Once values or fuzzy sets have been obtained or derived to represent each of the data entities 515-535 for the invitee, the fuzzy processor 500 applies one or more fuzzy rules 505 and corresponding rule weights 510 to combine the values for each of the data entities 515-535 in order to generate the response value to the meeting proposal 225 on behalf of the represented invitee(s). Preferably, a fuzzy rule 505 of the type

IF busyness\_of\_user at time t IS low

AND importance\_to\_user IS high  
AND availability\_of\_user at time t IS true  
AND importance\_of\_user IS high  
AND time preference of user at time t IS high  
5 THEN accept\_proposal\_support IS HIGH

is used to combine the values 515-535, where the time t is the proposed time of the meeting in the received meeting proposal 225. As above, the fuzzy set "HIGH" is converted into a value in the range [0,1] for output, a value that may be adjusted  
10 through feedback by the represented invitee(s) to fine-tune the performance of the attendee agent 110. The output value is usable by a number of different known scheduling techniques when attempting to determine the list of attendees for a requested meeting and will not be described in detail in the present patent specification.

15 A process will now be described, according to a preferred embodiment of the present invention, by which invitees may provide feedback 430, 540 to the proposer agent 100 and, more particularly, to their attendee agent 110, respectively, to trigger an adjustment of the response of the agents 100, 110 to a received meeting request 105. Preferably, an invitee or group of invitees provides appropriate feedback 430,  
20 540 once the effect of the respective agent's response has been determined in respect of that invitee or group of invitees, i.e. once the invitee becomes aware of the output of the scheduler and either appears or does not appear on a determined list of attendees for the requested meeting, scheduled to take place at a particular time and place.

25 Preferably, invitee feedback 430, 540 may comprise one of the following responses:

- 1) invitee asks for reschedule of meeting
- 2) invitee accepts schedule but "with reservations"
- 30 3) invitee rejects attendance
- 4) acceptance/no feedback.

In case 4) it is assumed that the attendee agent 110 has given the correct response and no further action is required. In cases 1)-3) the attendee agent 110 may be arranged to initiate a dialogue with the invitee to discover which of its assumptions need updating, i.e. which rule weights 510 or fuzzy sets (505) need to be adjusted. In case 1) the proposer agent 100 may also request a reschedule from the scheduler.

Preferably, an invitee responds either by a) explicitly, answering a message from the attendee agent 110 describing the parameters of a meeting it has "agreed to" (generated a high value) or b) implicitly, by altering or commenting on an entry made in the invitee's diary. The different invitee responses will now be described with reference to Figure 6.

Referring to Figure 6a, corresponding to invitee response 1) above, the invitee firstly, at STEP 600, requests a reschedule of the meeting. At STEP 605 the attendee agent 110 responds to the request by initiating a dialogue with the invitee to enable its rule base 505, 510 to be adjusted. Have completed the adjustment, at STEP 610 the attendee agent 110, or the propose agent 100, requests a rescheduling of the meeting by the scheduler system.

Referring to Figure 6b, corresponding to invitee response 2) above, the invitee firstly, at STEP 620, accepts the scheduled meeting but with reservations. At STEP 625, the attendee agent 110 initiates a dialogue with the invitee to enable its rule base 505, 510 to be adjusted in accordance with the invitee's reservations.

Referring to Figure 6c, corresponding to invitee response 3) above, the invitee firstly, at STEP 630, declines the meeting. At STEP 635, the attendee agent 110 initiates a dialogue with the invitee to enable its rule base 505, 510 to be adjusted in accordance with the invitee's reasons for rejection.

In each of the three types of response shown in Figure 6, a dialogue and adjustment step 605, 625, 635 is carried out by the attendee agent 110 on behalf of the invitee. A preferred process for carrying out these dialogue and adjustment steps 605, 625, 635 will now be described in more detail with reference to Figure 7.

Referring to Figure 7, at STEP 700 the attendee agent receives an invitee response 600, 620, 630 indicating that, to some degree, the attendee agent 110 has generated an incorrect response to a received meeting proposal 225. At STEP 705, the agent 110 asks the invitee whether the value for the parameter *Busyness of*

*invitee at proposed time* 515 was correct. If not, then at STEP 710 a process is executed by the attendee agent 110 to update the fuzzy rules 505, 510 relating to this parameter 515, as will be described below with reference to Figure 8. If the parameter 515 was correct, then at STEP 715, the attendee agent 110 asks the  
5 invitee whether the values for the parameter *Importance of meeting to the invitee* 535 was correct. If not, then at STEP 720 a process is executed by the attendee agent 110 to update the fuzzy rules 505, 510 relating to this parameter 535, as will be described below with reference to Figure 9. If the parameter 535 was correct, then at STEP 725, the attendee agent 110 asks the invitee whether the determined  
10 value for the invitee's *Preferences* parameter 530 for the proposed meeting time was correct. If not, then at STEP 730, the attendee agent 110 may be arranged, for example, to update the invitee's personalised fuzzy sets (505). For example, if the invitee indicates that the preference parameter value 530 was too high, then the membership value in the fuzzy set representing "HIGH" may be decreased, if too  
15 low, then the membership value may be increased. Alternatively, fuzzy representations of preferences stored in the user profile store 320 may be updated insofar as they relate to the proposed meeting time, e.g. a fuzzy preference for Tuesdays may need to be adjusted upwards or downwards, as appropriate.

If the parameter 530 was correct at STEP 725, then at STEP 735, the  
20 attendee agent 110 asks the invitee whether the fuzzy membership values for the parameter *Availability* 525 were correct. If so, then at STEP 740, the fuzzy rules 505 and rule weights 510 may be adjusted overall to reinforce the likelihood of the attendee agent 110 generating a similar response to a similar subsequent meeting proposal 225. In particular, updates may be carried out by the fuzzy processor 500  
25 by applying a rule of the type

IF X is LOW  
AND y is HIGH  
AND z is MEDIUM  
30 THEN proposal\_support is HIGH with weight W

where  $x$ ,  $y$  and  $z$  are fuzzy indications by the invitee of the correctness of the parameter values in questions 705, 715 and 725 above, respectively. The fuzzy processor 500 is arranged to make overall adjustments as follows:

- i) locate rules 505 which fire with highest fuzzy value  $V$ , decreasing the corresponding rule weights 510; and
- ii) locate rules 505 which fire with lower fuzzy values than  $V$ , increasing their rule weights 510.

A preferred process for carrying out updating STEP 710 in relation to the busyness parameter 515 will now be described with reference to Figure 8.

Referring to Figure 8, at STEP 800 the attendee agent 110 presents to the invitee the value of the busyness parameter 515 and the meeting parameters of time and duration. At STEP 805, the agent 110 asks the invitee if the fuzzy value  $B1$  representing the invitee's busyness on that day is correct. If the invitee indicates not, then at STEP 810, the fuzzy processor 500 is arranged to make an appropriate update to the corresponding fuzzy set. For example, if a `busy_day` fuzzy set is indicated by a fuzzy membership value of greater than 1, then if the derived parameter value for busyness 515 is too high, then the membership value for the `busy_day` fuzzy set may be adjusted downwards. Conversely, if the derived value 515 is too low, then the membership value for the `busy_day` fuzzy set may be adjusted upwards.

If at STEP 805, the busyness parameter 515 was correct, then at STEP 815 the agent 110 asks if the fuzzy value  $B2$  representing the invitee's busyness on that week is correct. If not, then at STEP 820, a similar updating step is carried out to that in STEP 810 above. If at STEP 815 the parameter value was also correct, then at STEP 825, a similar "reinforcing" update is made to the corresponding rules 505 and weights 510 as in STEP 740 of Figure 7 above.

A preferred process for carrying out updating STEP 720 will now be described with reference to Figure 9.

Referring to Figure 9, at STEP 900, the attendee agent 110 asks if the invitee importance parameter value was correct. If not, then at STEP 905, a fuzzy set corresponding to the invitee's importance in the organisation may be updated, e.g. if the agent 110 predicted a value that was too low, then the fuzzy membership value

associated with the invitee may be increased, or decreased if the predicted value was too high.

If, at STEP 900 the value was correct, then at STEP 910 the agent 100 asks if the rating of meeting subject importance was correct. If not, then at STEP 915 a  
5 corresponding update to fuzzy membership values is made, otherwise, at STEP 920, the agent 110 determines whether a meeting agenda was included in the original meeting request 105. If so, then at STEP 925 the agent 110 asks the invitee if the importance value for the agenda was determined to be correct. If not, then at STEP 930 a corresponding update to fuzzy membership values is made, otherwise, at STEP  
10 935, a similar "reinforcing" update is made to the corresponding rules 505 and weights 510 as in STEP 740 of Figure 7 above.

The processes for updating fuzzy rules and fuzzy sets in Figures 7 to 9 above may be extended to other meeting attributes, besides those specifically described. The general approach is to present the agent's (110) prediction of a particular  
15 parameter to the invitee. If this prediction does not match with the invitee's assessment then the fuzzy rules for that parameter are updated either by a) adjusting the membership values of the fuzzy sets (505), or b) adjusting the weights 510 corresponding to the rules 505. In the case where the invitee concurs with all the agent's assessments, but the final response to a meeting proposal 225 by the agent  
20 110 is not correct, then the overall rule base 505, 510 is updated accordingly.

There are a number of variations to preferred embodiments of the present invention described above that would be apparent to a person of ordinary skill in the art. For example, while the roles of proposer agent 100 and attendee agent 110 have been described as operating separately, then may of course be combined into a single  
25 software agent implementation while still treating the evaluation of a proposed meeting slot separately from the scheduling of the meeting. It would also be apparent that other combinations of parameters may be used to derive measures relevant to the evaluation of a meeting proposal 225 which continuing to employ the advantageous techniques of fuzzy processing and fuzzy representation used in  
30 preferred embodiments of the present invention.

## CLAIMS

1. A method for generating a response to a meeting proposal for use by a meeting scheduler, the meeting proposal comprising at least an indication of timing,  
5 location and invitees for the meeting, the method comprising the steps of:
  - (i) applying a first rule set to augment the meeting proposal with a measure of the assessed importance of each invitee or group of invitees to the proposed meeting; and
  - (ii) applying a second rule set to evaluate the augmented meeting proposal  
10 in respect of each said invitee or group of invitees, deriving at least a measure of the importance of the meeting to said invitee or group of invitees for use in the evaluation, and to generate a measure of the support by said invitee or group of invitees for the proposed meeting for use in a meeting scheduler.
- 15 2. A method as in Claim 1, wherein said first and second rule sets are fuzzy rule sets.
3. A method as in Claim 1 or Claim 2, further comprising the step:
  - (iii) in response to the inclusion or non-inclusion by said meeting scheduler  
20 of said invitee or group of invitees in a list of attendees for the proposed meeting, receiving feedback from said invitee or group of invitees, and adjusting said first or second rule sets in response thereto.

## ABSTRACT

## EVALUATION OF EVENT PROPOSALS

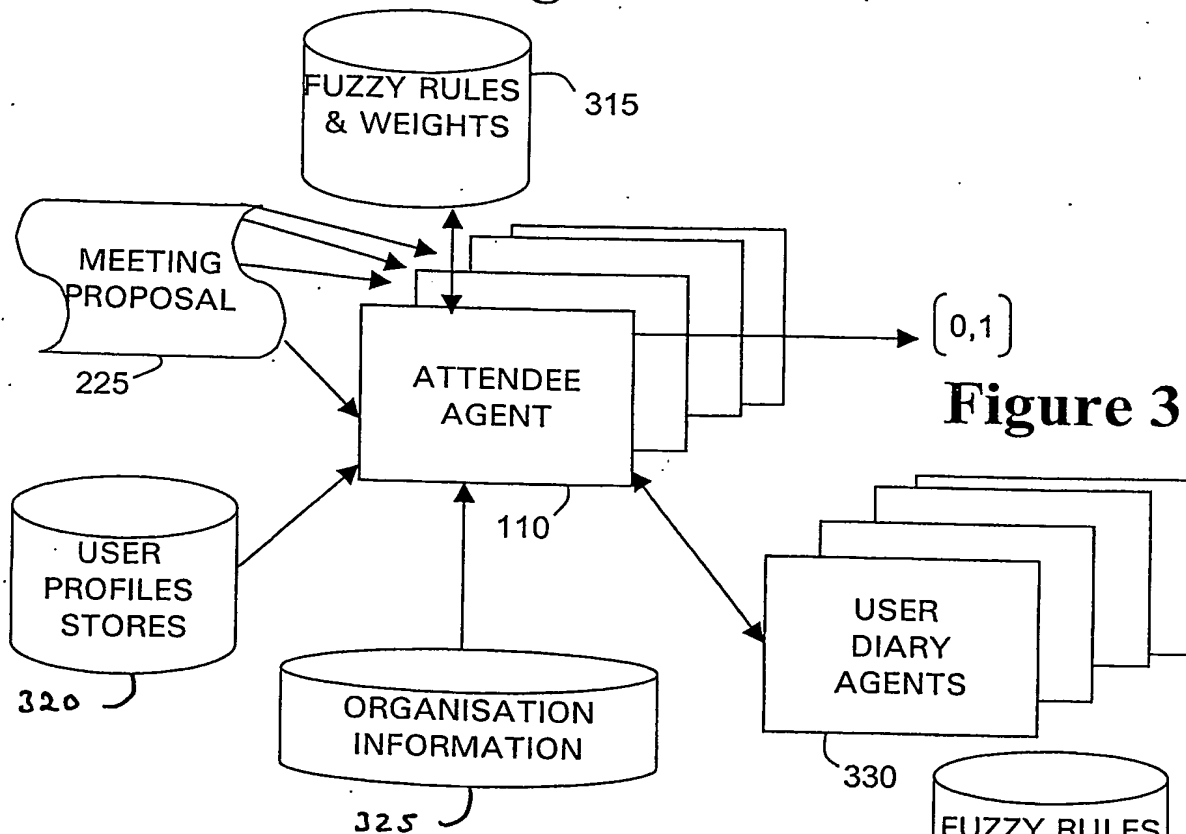

- 5        A method and apparatus are provided for generating a response to a meeting proposal for use by a meeting scheduler, the meeting proposal comprising at least an indication of timing, location and invitees for the meeting, the method comprising the steps of:
- 10        (i)    applying a first rule set to augment the meeting proposal with a measure of the assessed importance of each invitee or group of invitees to the proposed meeting; and
- 15        (ii)    applying a second rule set to evaluate the augmented meeting proposal in respect of each said invitee or group of invitees, deriving at least a measure of the importance of the meeting to said invitee or group of invitees for use in the evaluation, and to generate a measure of the support by said invitee or group of invitees for the proposed meeting for use in a meeting scheduler.
